

Soil Test Report

FARMERS DETAILS

Farmers Name: Joshua Otieno
Agent: Justus
Farm Name: Manure
Date of Soil Test: June 15 2026

Test Results

Parameter	Unit	Result	Guide Low	Guide High	Low	Optimum	High
Nitrogen	%	0.19	0.50	1.50			
Phosphorous	mg/kg	201	10	30			
Potassium	mg/kg	2910	75	300			
pH		5.5	5.5	7.5			
EC	us/cm	18400		4000			

Analysis Summary

- The nitrogen level is slightly low compared to the expected range.
- The phosphorus level is very high.
- The potassium level is very high.
- EC is very High: raw application poses an immediate risk of osmotic shock ("root burn") to crops, particularly salt-sensitive young seedlings or shallow-rooted vegetables.
- Soil pH is optimal. The pH is ideal for supporting soil microbial activity without altering baseline soil acidity.

Key Notes

- Do not apply the manure directly to active root zones. It must undergo a minimum of 60 to 90 days of aerobic composting to allow microbial populations to immobilize the excess salts, stabilize the nitrogen into organic forms, and lower the overall EC to safer levels.
- Application Timing & Incorporation: If applied uncomposted, it must be broadcasted and thoroughly incorporated into the top 15 cm of soil at least 3 to 4 weeks prior to planting to allow seasonal rainfall or irrigation to leach the soluble salts throughout the soil profile.
- Targeted Crop Strategy: Prioritize utilizing this amendment on deep-rooted, salt-tolerant crops rather than sensitive legume seeds or leafy greens.
